1 Weil Reciprocity

$$f(\text{div}(g)) = g(\text{div}(f))$$

1.1 Proof

Let $z \in \mathbb{P}^1$ and $f_*\langle g \rangle(z) = g(T_1) \cdots g(T_n)$ where $\{T_1, \dots, T_n\} = f^{-1}(z)$ is the fiber for z .

We claim that $f_*\langle g \rangle(\text{div } z) = g(\text{div } f)$.

$$f^{-1}(z) = \{T_1, \dots, T_n\}$$

$$f_*\langle g \rangle(z) = g(T_1) \cdots g(T_n)$$

But $\text{div } z = [0] - [\infty]$

$$f_*\langle g \rangle(0) = g(T_1) \cdots g(T_n)$$

where $T_i \in f^{-1}(0)$, which are the zeros of $f \Rightarrow f_*\langle g \rangle([0] - [\infty]) = g(\text{div } f)$.

Likewise $z(\text{div } f_*\langle g \rangle) = f(\text{div } g)$ which using the argument above is easy to see.

$$f_*\langle g \rangle([0] - [\infty]) = f_*\langle g \rangle(0) / f_*\langle g \rangle(\infty) = z(\text{div } f_*\langle g \rangle)$$

By the fact $P/Q(\text{div } z) = (p_0/q_0)/(p_m/q_m) \Rightarrow z(\text{div } P/Q) = (\text{product of roots of } P) / (\text{product of roots of } Q)$.

2 Divisor Construction

We can either use the Miller loop, or Mumford polynomial representation. Both are trivial.

We end up with a polynomial f that represents our divisor.

3 Proving Interpolation

Let $f \in K(C)^\times$, with roots P_1, \dots, P_n . Then the norm

$$f(P)f(-P) = (x(P) - x(P_1)) \cdots (x(P) - x(P_n))$$

Canonical form is $f(x, y) = v(x) + yw(x)$. The conjugate of f is $\bar{f} = v(x) - yw(x)$ and the norm is

$$N_f = f \cdot \bar{f} = v(x)^2 - (x^3 + Ax + B)w(x)^2$$

For $r = \frac{f}{g} \in K(C)$

$$\frac{f}{g} = \frac{fg}{gg} = \frac{fg}{N_g}$$

But this norm also counts $-P$ which we want to disallow. We instead use the resultant.
